Overview

The Arduino UNO is the best board to get started with electronics and coding. The Arduino Uno Rev 3 is a microcontroller board based on the ATmega328, an 8-bit microcontroller with 32KB of Flash memory and 2KB of RAM, which is the most used and documented board of the whole Arduino family.

Key Features

01 **Excellent performance**

It comes with an 8-bit microcontroller ATmega328P, 32 KB of flash memory, 2 KB of SRAM and 1 KB of EEPROM capable of many Arduino projects.

02 **Mature and stable**

There are many tutorials that use this version of Arduino as a reference board.

03 **High cost-effective**

The board is inexpensive and more than adequate for beginners.

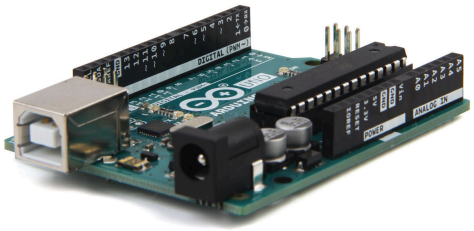

04 **USB easy download program**

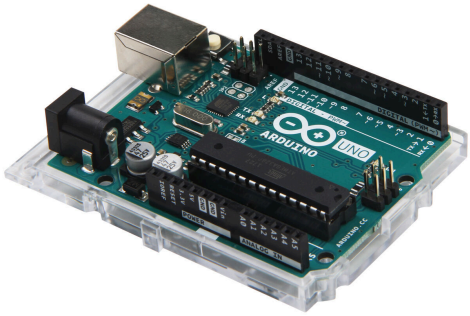

All you need is a USB cable to connect your computer and you can power it, download programs and communicate with data.

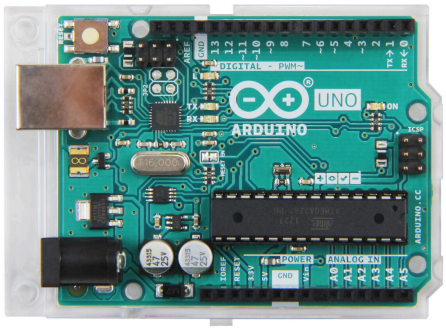

05 **Best Arduino entry board**

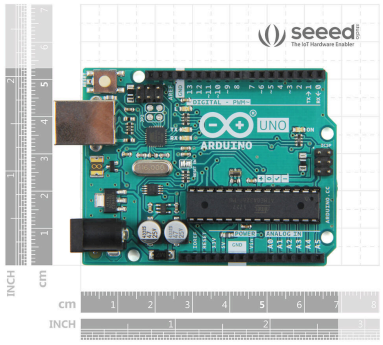

If this is your first experience tinkering with the platform, the UNO is the most robust board you can start playing with.

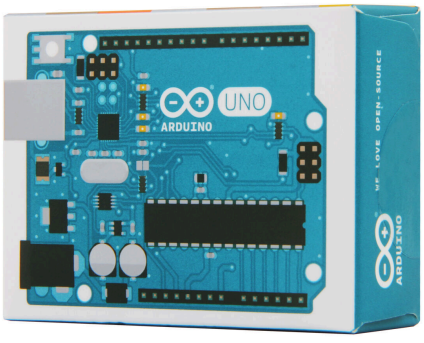

Product Gallery

Applications

- **Smart Homes**
- **IoT Projects**
- **Arduino Beginner**
- **Multi-Sensor Application**
