DISCLAIMER

Please Read Carefully:
Realtek Semiconductor Corp., (Realtek) reserves the right to make corrections, enhancements, improvements and other changes to its products and services. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

Reproduction of significant portions in Realtek data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Realtek is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions.

Buyers and others who are developing systems that incorporate Realtek products (collectively, “Customers”) understand and agree that Customers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Customers have full and exclusive responsibility to assure the safety of Customers’ applications and compliance of their applications (and of all Realtek products used in or for Customers’ applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Customer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Customer agrees that prior to using or distributing any applications that include Realtek products, Customer will thoroughly test such applications and the functionality of such Realtek products as used in such applications.

Realtek’s provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation kits, (collectively, “Resources”) are intended to assist designers who are developing applications that incorporate Realtek products by downloading, accessing or using Realtek’s Resources in any way. Customer (individually or, if Customer is acting on behalf of a company, Customer’s company) agrees to use any particular Realtek Resource solely for this purpose and subject to the terms of this Notice.

Realtek’s provision of Realtek Resources does not expand or otherwise alter Realtek’s applicable published warranties or warranty disclaimers for Realtek’s products, and no additional obligations or liabilities arise from Realtek providing such Realtek Resources. Realtek reserves the right to make corrections, enhancements, improvements and other changes to its Realtek Resources. Realtek has not conducted any testing other than that specifically described in the published documentation for a particular Realtek Resource.

Customer is authorized to use, copy and modify any individual Realtek Resource only in connection with the development of applications that include the Realtek product(s) identified in such Realtek Resource. No other license, express or implied, by estoppel or otherwise to any other Realtek intellectual property right, and no license to any technology or intellectual property right of Realtek or any third party is granted herein, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which Realtek products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of Realtek Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from Realtek under the patents or other Realtek’s intellectual property.

Realtek’s Resources are provided “as is” and with all faults. Realtek disclaims all other warranties or representations, express or implied, regarding resources or use thereof, including but not limited to accuracy or completeness; title, any epidemic failure warranty and any implied warranties of merchantability, fitness for a particular purpose, and non-infringement of any third party intellectual property rights.

Realtek shall not be liable for and shall not defend or indemnify Customer against any claim, including but not limited to any infringement claim that related to or is based on any combination of products even if described in Realtek Resources or otherwise. In no event shall Realtek be liable for any actual, direct, special, collateral, indirect, punitive, incidental, consequential or exemplary damages in connection with or arising out of Realtek’s Resources or use thereof, and regardless of whether Realtek has been advised of the possibility of such damages. Realtek is not responsible for any failure to meet such industry standard requirements.

Where Realtek specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Customers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any Realtek products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death. Such equipment includes, without limitation, all medical devices identified by the U.S. FDA as Class III devices and equivalent classifications outside the U.S.
Customers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Customers’ own risk. Customers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Customer will fully indemnify Realtek and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer’s non-compliance with the terms and provisions of this Notice.

1 Product Overview

1.1 General Description

RTL872xD is a highly integrated single-chip low power dual bands (2.4GHz and 5GHz) Wireless LAN (WLAN) and Bluetooth Low Energy (v5.0) communication controller. It consists of a high-performance MCU (ARM v8m, Cortex-M4F instruction compatible) named KM4, a low power MCU (v8m, Cortex-M0 instruction compatible) named KM0, WLAN (802.11 a/b/g/n) MAC, an 1T1R capable WLAN baseband, RF, Bluetooth and peripherals.

High speed connectivity interfaces, SDIO and USB are provided. There are also audio codec, Key-Scan and touch keys integrated into this IC. Besides, flexible design configures GPIO to different functions according to applications.

RTL872xD also integrates memories (ROM/SRAM/PSRAM) for IoT (Internet of Things) Wi-Fi protocol functions and applications. The user-friendly development kits (SDK and HDK) are supported to customers for developing IoT applications.

The KM4 MCU is a 32-bit core that offers system enhancements such as low power consumption, enhanced debug features, floating point computation, DSP instructions and a high level of support block integration. The KM4 MCU incorporates a 3-stage pipeline.

The KM0 coprocessor is an energy-efficient and easy to use 32-bit core which is code- and tool-compatible with the KM4 core. The KM0 coprocessor offers up to 20MHz performance with a simple instruction set and reduced code size.

1.2 System Architecture

The system architecture of RTL872xD is shown in Fig 1-1.
In RTL872xD, the main system consists of 32-bit multilayer AXI bus matrix that interconnects all the masters and the slaves. The bus matrix provides access from a master to a slave, enabling concurrent access and efficient operation even when several high-speed peripherals work simultaneously.

A multilayer AXI bus matrix connects the CPU buses and other bus masters to peripherals in a flexible manner that optimizes performance by allowing peripherals on different slave ports of the matrix to be accessed simultaneously by different bus masters.

APB peripherals are connected to the AXI bus matrix via APB buses using separate slave ports from the multilayer AXI bus matrix. This allows for better performance by reducing collisions between the CPU and the DMA controller, and also for peripherals on the asynchronous bridge to have a fixed clock that does not track the system clock.

1.3 Features

1.3.1 System and Memory

The system and memory features of RTL872xD are listed in Table 1-1.

<table>

</tr>
<tr>
<td></td>
<td>• Support HS/FS/LS mode</td>
</tr>
<tr>
<td></td>
<td>• Internal DMA support, DMA works based on register settings</td>
</tr>
<tr>
<td></td>
<td>• 1.5KByte bulk-in buffer and 1.5KByte bulk-out buffer</td>
</tr>
<tr>
<td>SPI</td>
<td>• Support Motorola SPI Serial interface operation</td>
</tr>
<tr>
<td></td>
<td>• Support master or slave operation mode</td>
</tr>
<tr>
<td></td>
<td>• Provide two SPI ports:</td>
</tr>
<tr>
<td></td>
<td>• SPI0 (High speed): configured as master or slave with Max. baud rate: 50MHz.</td>
</tr>
</tbody>
</table>
### SPI1 (Normal speed): configured as master with Max. baud rate: 25MHz.
- Support DMA interface for DMA transfer
- Independent masking of interrupts
- FIFO depth – The transmit and receive FIFO buffers 64 words deep. The FIFO width is fixed at 16 bits.
- Hardware/software slave-select – Dedicated hardware slave-select lines can be used or software control can be used to target the serial-slave device
- Programmable features:
  - Clock bit-rate – Dynamic control of the serial bit rate of the data transfer; used in only serial-master mode of operation.
  - Data item size (4 to 16 bits) – Item size of each data transfer under the control of the programmer.
  - Configurable clock polarity and phase
  - Programmable delay on the sample time of the received serial data bit (rxd), when configured in Master Mode; enables programmable control of routing delays resulting in higher serial data-bit rates.

### UART
- Support UART format: 1 start bit, 7/8 data bits, 0/1 parity bit and 1/2 stop bit
- Support a very wide range of baud rate
- Support auto flow control
- Support interrupt control
- Support IrDA
- Support loopback mode for test
- Differentiate clock for Tx path and Rx path
- Fractional baud rate generator for Tx path
- Low power mode for Rx path
- Monitor and eliminate Rx baud rate error and own frequency drift automatically for new Rx path
- Support DMA mode
- Option for UART Rx to be DMA flow controller

### IR (Infra Ray)
- Support carrier frequency from 25KHz to 500KHz
- Support Duty from 1/2 to 1/5
- Support IR diode input
- Support IR receiver module input
- 32*4 bytes Tx FIFO
- 32*4 bytes Rx FIFO
- Tx carrier frequency can be configured
- Tx carrier duty cycle can be configured

### One wire (SGPIO)
- One wire communication interface for security element
- Timer Mode:
  - Rx and Multiple Timer are 16-bit timer with a 16-bit prescaler.
  - Rx and Multiple Timer can stop, reset, and interrupt by match events.
  - Rx and multiple timer/counter can stop and reset to each other.
- Capture Mode:
  - Rx timer can be captured by capture events.
  - Capture events can be Rx trigger events or the multiple match events.
  - The capture value can be transferred to ‘0’ or ‘1’ by comparing the value.
- Counter Mode:
  - Multiple Counter can count Rx trigger events.
- External Output Mode:
  - External output can set high, low or toggle on the match event.
- Get the serial input:
  - Shift the input value to a 32-bit FIFO by match events.
- Send the serial output:
  - Send the ‘0’ or ‘1’ waveform by shifting the output value of a 32-bit FIFO. This output value decides that the external match uses the match value of group 0 or group 1.
  - Change the output value by using the multiple FIFO data to update the multiple match value.
- Monitor Mode:
  - Monitor the receiving value to make the interrupt in the power saving mode.

### I2C
- Two-wire I2C serial interface – consists of a serial data line (SDA) and a serial clock (SCL)
1.3.5 Audio

The secure features of RTL872xD are listed in Table 1-5.

<table>

| Audio DAC and earphone driver | - Sampling Frequency: 8/16/32/44.1/48.2/96KHz  
- Integrates earphone driver  
  - 40mW on 16Ω load  
  - 20mW on 32Ω load  
- Gain Control in DAC Path  
  - Gain Step: 0.375dB/step  
  - Gain Range: -64.5dB ~ 0dB  
- Audio output mode:  
  - Line-Out Cap-less mode (QFN88)  
  - Line-Out Differential mode (QFN88)  
  - Line-Out Single-end mode |
| Audio ADC | - Sampling Frequency: 8/16/32/44.1/48.2/96KHz  
- ADC input gain range:  
  - Gain Step: 0.375dB/step  
  - Gain Range: -17.625dB ~ 30dB (digital)  
- MIC input boost gain stage: 0/20/30/40dB (analog)  
- Audio Input mode:  
  - Line-In  
  - Analog MICx2 or Digital MICx2 |
| I²S | - Sample rate:  
  - 8/12/16/24/32/48/64/96/192/384/7.35/11.025/14.7/22.05/29.4/44.1/58.8/88.2/176.4kHz  
- I²S channel number: mono, stereo, 5.1 channel  
- Sample bit for mono: 16-bit, 32-bit  
- Sample bit for stereo & 5.1 channel: 16-bit, 24-bit, 32-bit  
- Integrated DMA engine to minimize the software efforts  
- Support mono and stereo Tx or Rx or Tx & Rx mode  
- Support 5.1 Tx mode (DAC), not support Rx mode (ADC)  
- Not support PCM mode |
1.3.6 Timer

The timer features of RTL872xD are listed in Table 1-6.

<table>
<thead>
<tr>
<th>Items</th>
<th>Description</th>
</tr>
</thead>
</table>
| Basic Timers (HS_TIM0 ~ HS_TIM3) (LP_TIM0 ~ LP_TIM3) | - Channels: x1  
- Clock source: 32KHz  
- Resolution: 32-bit  
- Counter mode: up  
- Interrupt generation  
- Sleep mode wakeup |
| PWM Timers (HS_TIM & LP_TIM) | - Channels: HS_TIM5 x18, LP_TIM x6  
- Clock source: XTAL  
- Resolution: 16-bit  
- Prescaler: 8-bit  
- Counter mode: up  
- Statistics pulse width  
- Statistics pulse counter  
- Input capture pin: x2  
- Interrupt generation  
- LP_TIM5 can work at sleep mode |
| Pulse Timers (HS_TIM4 & LP_TIM) | - Channels: HS_TIM5 x18, LP_TIM x6  
- Clock source: XTAL  
- Resolution: 16-bit  
- Prescaler: 8-bit  
- Counter mode: up  
- One pulse mode  
- PWM mode with polarity selection  
- Input capture pin: x2  
- Interrupt generation |
| Real-Time clock (RTC) | - Independent BCD timer/counter  
- Time with seconds, minutes, hours, days (12- or 24-hour format)  
- Daylight saving compensation programmable by software  
- One programmable alarm with interrupt function. The alarm can be triggered by any combination of the time fields.  
- Maskable interrupts/events  
- Alarm  
- Digital calibration circuit  
- Register write protection |

1.3.7 Human-computer Interaction

The human-computer interaction features of RTL872xD are listed in Table 1-7.

<table>
<thead>
<tr>
<th>Items</th>
<th>Description</th>
</tr>
</thead>
</table>
| Key-matrix | - Up to 8*8 (64) Keypad Array with use of 16 GPIOs  
- Configurable Rows and Columns of Keypad Array  
- Hardware debounce with configurable time at each scan  
- Configurable Scan Clock, Scan Interval and Release Time  
- Support interrupts, provide interrupts mask, interrupts clear, interrupts status  
- Multi-keys detect  
- Provide FIFO with width of 12 bits and depth of 16 to store Key Press and Release Events  
- Support low power mode. Key press event can wakeup CPU from sleep. |
| Cap-Touch | - Support 4 capacitive sensor channels |
1.3.8 Analog

The analog features of RTL872xD are listed in Table 1-8.

<table>
<thead>
<tr>
<th>Items</th>
<th>Description</th>
</tr>
</thead>
</table>
| Data capture ADC and voltage comparator | Resolution: 12-bit SAR  
|                                    | Available channel number  
|                                    | 7x external 3.3V channel and 1x 5V channel  
|                                    | 3x internal channel  
|                                    | Configurable input  
|                                    | Single-end  
|                                    | Differential with predefined channel pair  
|                                    | Contain 64 FIFO entries which is 16-bit width  
|                                    | Multi-Channel DMA support  
|                                    | Multi sampling trigger sources  
|                                    | Software  
|                                    | Timer  
|                                    | 1 low power voltage comparator for battery voltage measurement  
|                                    | Conversion item control or another FIFO level to trigger wakeup circuit |

1.4 Peripherals

The peripherals of RTL872xD under different packages are shown in Table 1-9.

### 2.1.1 QFN48

The QFN48 pin assignments for RTL8720DN-VA1/RTL8720DM-VA1 are shown in Fig 2-1.
2.1.2 QFN68

The QFN68 pin assignments for RTL8721DN-VRC are shown in Fig 2-2, and QFN68 pin assignments for RTL8721DM-VA1 are shown in Fig 2-3.
Fig 2-2 QFN68 pin assignments for RTL8721DN-VRC
2.1.3 QFN88

The QFN88 pin assignments for RTL8722DM-VA1 are shown in Fig 2-4.
2.2 Low Power Pins

These pins can work and wakeup MCU under deepsleep mode, as Table 2-2 shows. All these pins are located at Key-Scan pins.
2.3 Pin Default Configuration

All pins are configured as GPIO without pull resistors except some special function like SWD or LOGUART. The pin default configuration is listed in Table 2-3.

<table>
<thead>
<tr>
<th>Pin Name</th>

4 Memory Organization

4.1 Introduction

The RTL872xD incorporates several distinct memory regions. Program memory, data memory, registers and I/O ports are organized within the same linear 4Gbyte address space. The bytes are coded in memory in Little-Endian format.

The addressable memory space is divided into multiple main blocks, as shown in Table 4.1. All the memory areas that are not allocated to on-chip memories and peripherals are considered “RSVD” (reserved). For the detailed mapping of available memory and register areas, refer to the following sections.

Table 4-1 Address space main blocks

4.4  KM4 Embedded SRAM

The KM4 contains up to a total 512KB of contiguous, on-chip static RAM memory. This embedded SRAM can be accessed as bytes (8 bits), half-words (16 bits) or full words (32 bits). It is divided into the following two blocks which can be accessed by both KM4 and KM0.
- KM4 SRAM1 (up to 256KB)
- KM4 SRAM2 (up to 256KB)

Dividing SRAM into two slave ports allows user’s program to potentially obtain better performance. For example, simultaneous access to SRAM1 by the CPU and by the system DMA controller does not result in any bus stalls for either master.

Generally speaking, the CPU reads or writes all peripheral data at some point, even when all such data is read from or sent to a peripheral by DMA. So, minimizing stalls is likely to involve putting data to/from different peripherals in RAM on each port.

Alternatively, sequences of data from the same peripheral can be alternated between RAM on each port. This could be helpful if DMA fills or empties a RAM buffer, and signals the CPU before proceeding on to a second buffer. The CPU then tends to access the data while the DMA is using the other RAM.

In power domains, the entire SRAM is also divided into three blocks:
- SRAM_PD1 (up to 256KB)
- SRAM_PD2 (up to 128KB)
- SRAM_PD3 (up to 128KB)
Each block can be disabled or enabled individually in the Power Management Unit (PMU) block to save power, and the entire SRAM can also keep power for quickly resuming from sleep mode when system enters sleep mode.

4.5  KM0 Embedded SRAM

The KM0 features 64KB of system SRAM, the embedded SRAM can be accessed as bytes (8 bits), half-words (16 bits) or full words (32 bits).

This SRAM can be accessed by both KM4 and KM0.

4.6  KM4 Extension SRAM

When Bluetooth is disabled, more 64KB SRAM will be extended. This SRAM can also be accessed by both KM4 and KM0, up to 50MHz*32 bits.

4.7  Retention SRAM

The RTL872xD features 1KB of retention SRAM in order to allow saving data with minimal power usage during deepsleep mode.

This SRAM can be accessed by both KM4 and KM0.

4.8  SPI Flash Memory

The SPI Flash Controller (SPIC) manages CPU I-Code and D-Code accesses to the Flash memory. It implements the erase and program Flash memory operations, and the read/write protection mechanisms. It accelerates code execution with a system of instruction prefetch and cache lines.

4.9  PSRAM

4MB 8IO DDR PSRAM is included in RTL872xD, up to 50MHz DDR.
5 Nested Vectored Interrupt Controller (NVIC)

5.1 Features

All interrupts including the core exceptions are managed by the NVIC. The nested vector interrupt controller NVIC includes the following features:

- Nested Vectored Interrupt Controller that is an integral part of each CPU.
- Tightly coupled interrupt controller provides low interrupt latency.
- Controls system exceptions and peripheral interrupts.
- The NVIC of the KM4 supports:
  - 58 vectored interrupts.
  - 8 programmable interrupt priority levels with hardware priority level masking.
  - Vector table offset register VTOR.
- The NVIC of the KM0 supports:
  - 32 vectored interrupts.
  - 4 programmable interrupt priority levels with hardware priority level masking.
  - Vector table offset register VTOR.
- Support for NMI from any interrupt.

The NVIC and the processor core interface are closely coupled, which enables low latency interrupt processing and efficient processing of late arriving interrupts.

5.2 NVIC Diagram

The diagram of NVIC is shown in Fig 5-1.

![Fig 5-1 NVIC diagram](image)

Most of KM0 interrupt signals are linked to KM4 NVIC at the same interrupt number like LOGUART, and other KM0 interrupt signals are not linked to KM4 NVIC like WDG/RX1300/IPC.

This mechanism let KM4 use KM0’s peripheral like it is KM4’s peripheral. But if an interrupt signal is shared by KM0 and KM4, just only one CPU can open this interrupt, if not, software will hang.

5.3 NVIC Table

Table 5-1 lists the interrupt sources for each peripheral function. Each peripheral device may have one or more interrupt lines to the Vectored Interrupt Controller. Each line may represent more than one interrupt source. The interrupt number does not imply any interrupt priority.

**Note:** The macro "configLIBRARY_MAX_SYSCALL_INTERRUPT_PRIORITY", which is used to define the highest interrupt priority controlled by FreeRTOS, is very important to interrupt. If the interrupt safe FreeRTOS API functions are called by the interrupt service routine, the priority of it must not be higher than this macro. Do not call RTOS_ISR functions from any interrupt that has a higher priority than this macro.

6 Wi-Fi Radio Characteristics

6.1 Wi-Fi RF Block Diagram

The Wi-Fi RF block diagram of RTL872xD is given in Fig 6-1.

![Fig 6-1 Wi-Fi RF block diagram](image)

The radio frequency (RF) specifications of Wi-Fi are described in the tables below. These values are measured on the QFN68 board.

### 7.2.2 Digital I/O Pin

The digital I/O pin DC characteristics of RTL872xD are shown in Table 7-3 and Table 7-4, which illustrate 3.3V and 1.8V respectively.

**Note:** VDDx is the supply power of VD1833.

#### 7.3.1 Power on or Resuming from Deepsleep Sequence

The timing sequence of power on or resuming from deepsleep is given in Fig 7-1.

![Fig 7-1 Timing sequence of power on or resuming from deepsleep](image)

#### 7.3.2 Shutdown Sequence

The timing sequence of shutdown is illustrated in Fig 7-2.

![Fig 7-2 Timing sequence of shutdown](image)
### 7.4 GPIO Pull Low Restriction

When one of the GPIOs listed below needs to be pulled low by a resistor on PCB, the pull low resistor value must > 1K Ohm.
