Overview

This document focuses on the use of the radar, the issues that need to be paid attention to in each phase, to minimize the design cost and increase the stability of the product, and to improve the efficiency of the project completion. This document focuses on the issues that need to be taken into account in each phase, in order to minimize the design cost and increase the stability of the product, and to improve the efficiency of the project completion.

From hardware circuit reference design, radar antenna and housing layout requirements, how to distinguish interference and multi-functional standard UART protocol output. The radar is a self-contained system.

This radar is a self-contained space sensing sensor, which consists of RF antenna, radar chip and high speed MCU. The radar is a self-contained sensor with a combination of RF antenna, radar chip and high-speed main frequency MCU. It can be equipped with a host computer or host computer to flexibly output detection status and data, and meet the needs of several groups of GPIOs. It can be equipped with a host computer or a host computer to flexibly output detection status and data, and meet several groups of GPIOs for user customization and development.
1. Working Principle

The radar transmits a 24G band millimeter wave signal, and the target reflects the electromagnetic wave signal, and demodulates it from the transmitted signal. The signal is demodulated, then amplified, filtered, ADC and other processing to obtain the echo demodulation signal data. In the MCU unit, the amplitude, frequency and phase of the echo signal are decoded, and the target signal is finally decoded. The target parameters (sleep quality, respiration, tossing, body movement, etc.) are measured and evaluated in the MCU.

2. Hardware Design Considerations

The rated supply voltage of the radar needs to meet 4.9 - 6V, and the rated current needs to be 200mA or more input is required. The power supply is designed to have a ripple of \( \leq 100\text{mv} \).

2.1 Power supply can refer to the following circuit design

![Circuit Diagram](image-url)
2.2 Wiring Diagram

3. Antenna and housing layout requirements

PCBA: Need to keep the radar patch height \( \geq 1 \text{mm} \) higher than other devices

Housing structure: need to keep the radar antenna surface and the housing surface have 2 - 5mm distance

Housing detection surface: non-metallic housing, need to be straight to avoid bending surface, affect the performance of the whole sweep surface area Performance
4. Electrostatic protection

Radar products with electrostatic sensitive circuitry inside, vulnerable to electrostatic hazards, so need to be in transport, storage, work and handling process to do a good job of electrostatic protection, do not touch the grasp of the radar hands. Therefore, it is necessary to do a good job in the transportation, storage, work and picking up process of static protection, do not touch and grab the radar module antenna surface and connector pins, only touch the corners. Do not touch the surface of the radar module antenna and connector pins with your hands, only touch the corners.

When handling the radar sensor, please wear anti-static gloves as much as possible.

5. Interference terms

5.1 Reported information is misidentified as occupied while unoccupied

Under normal circumstances, the sensor will accurately determine the body's sedentary state and movement state, and output the corresponding vital signs and other information. The influencing factors leading to such errors may be the following possibilities.

A. Strong penetration ability of the sensor, the movement behind the doorway or boarded wall is detected.
Adjustment: Reduce the radar sensitivity and set the radar scene according to the range and environment.

B. The lower side of the sensor is facing the running air conditioner, fan and other motion equipment.

Adjustment method: adjust the radar position, do not directly face the air conditioner, fan and other equipment.

C. Air conditioning wind caused by the shaking of objects.

Adjustment method: cotton, non-metal objects will not cause false alarms, metal objects need to be fixed.

D. Radar is not fixed, its own vibration caused by false alarms.

Adjustment method: avoid supporting shaking, vibration.

E. Pets, flying birds and other occasional movement of living organisms in the detection environment.

Adjustment method: As the sensor measures the value of spatial fluctuations, the sensitivity is very high, it is impossible to exclude this interference, try not to have in the environment in addition to the object of detection of living organisms.

F. Power interference, resulting in occasional misjudgment.

Adjustment method: try to keep the supply current stable and reduce ripple.

5.2 The current environment is occupied, but the sensor anomaly is reported as unoccupied.

The sensor sends and receives signals through electromagnetic waves to determine the presence of the human body. The closer the distance to the radar, the higher the accuracy.

A. The human body is outside the detection range of the sensor.

Adjustment method: adjust the installation angle of the sensor. The measurement range of the sensor in different environments, the electromagnetic wave reflection area is different, the scanning area will have a small difference.

B. Metal obscuring the sensor causes false output.

Excessively thick desks and chairs, metal seats. Will block the electromagnetic wave penetration, resulting in misjudgment.
6. Detailed explanation of functions

6.1 Function Description

<table>
<thead>
<tr>
<th>Function</th>
<th>Status change time/function explanation</th>
</tr>
</thead>
</table>
| DP1: occupied/unoccupied | From unoccupied to occupied, report within 0.5s  
From occupied to unoccupied, report within 50 s |
| DP2: Someone is stationary/someone is active | Reported within 0.5 seconds |
| DP3: Someone close to the device/Someone moving away from the device /Someone moving without direction | Reported within 0.5s  
Continuous 3s close/away will report continuous close/continuous away status |
| DP4: Body movement parameter | Reported within 1 seconds |
| DP5: Sensitivity setting 1 - 3 gears | Default is sensitivity 3  
Support 3 gears Adjustment, the higher the sensitivity, the larger the stationary detection area |
| DP7: Scene mode (default, regional detection, bathroom, hotel, bedroom, office) | According to the size of the area, adapted to different scenes |

6.2 Description of Body Movement Parameters

<table>
<thead>
<tr>
<th>Body Movement Parameters</th>
<th>0%</th>
<th>1%</th>
<th>2%-30%</th>
<th>31%-60%</th>
<th>61%-100%</th>

7. Protocol Description

This protocol is applied to the communication between the 24G millimeter wave Human Stationary Presence Module and the host computer.

This protocol outlines the radar workflow, briefly introduces the interface protocol composition architecture, and The interface protocol structure is briefly introduced, and the related radar work requires control commands and data.

Interface level: TTL
Baud rate: 9600bps
Stop bit: 1
Data bits: 8
Parity check: None

8. Communication command and parameter definition

8.1 Frame structure definition and description

8.1.1 Definition of frame structure

<table>
<thead>
<tr>
<th>Frame Header</th>
<th>Data Length</th>
<th>Function Code</th>
<th>Address_1</th>
<th>Address_2</th>
<th>Data</th>
<th>Checksum</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x55</td>

<tr>
<td>1 Byte</td>
<td>1 Byte</td>
<td>1 Byte</td>
<td>1 Byte</td>
<td>1 Byte</td>
<td>n Byte</td>
<td>1 Byte</td>
</tr>
</tbody>
</table>

8.1.2 Description of the frame structure

a. Start code: 1Byte, fixed to 0x55.

b. Data length: 2 Byte, low byte before, high byte after.

Length = Data Length + Function Code + Address Code 1 + Address Code 2 + Data + Checksum.

c. Function code: 1 Byte
Read command: 0x01
Write command: 0x02
Passive report command: 0x03
Active report command: 0x04
d. Address code: Address code 1 indicates the function classification, and address code 2 indicates the specific function.
See the description of address assignment and data information.
e. Data: n Byte
f. Checksum: 2 Byte, low byte in front, high byte at the end.
Use CRC16 checksum, see Appendix 1 for reference code

### Description:

1) The read/write commands are sent from the host computer to the sensor.
2) The report command is a message sent from the radar to the host computer.
3) Sensitivity is 1-3 gears, default 3 gears, the greater the gear, the more sensitive.
